**Supplementary Table 5:** Stage 1 association results of GWAS meta-analysis of eGFRcrea

Results are from meta-analysis of a total of 74,354 subjects, using the inverse variance weighted fixed effects method. Gene-specific significance thresholds were defined according to the Bonferroni method, as 0.05 / number of independent linkage disequilibrium blocks within each gene (number of independent blocks were identified by grouping SNPs in LD as defined by  $r^2 > 0.2$ , based on HAPMAP Phase 2 release 21), NA = no available common SNP listed in HAPMAP. eGFR = estimated glomerular filtration rate, CKD = eGFR  $< 60 \text{ ml/min}/1.73\text{m}^2$

**Supplementary Table 6: Stage 1 discovery association results of GWAS meta-analysis of CKD**

Results are from meta-analysis of a total of 70,484 subjects, using the inverse variance weighted fixed effects method. Gene-specific significance thresholds were defined according to the Bonferroni method, as 0.05 / number of independent linkage disequilibrium blocks within each gene (number of independent blocks were identified by grouping SNPs in LD as defined by  $r^2 > 0.2$ , based on HAPMAP Phase 2 release 21), NA = no available common SNP listed in HAPMAP. eGFR = estimated glomerular filtration rate, CKD = eGFR < 60 ml/min/1.73m<sup>2</sup>.
